Form Builder With Validators

- Validators should be imported from @angular/forms
- Use FormBuilder to construct the reactive form
  - reduce repetition and clutter

```
this.feedbackForm = this.fb.group({
    firstname: ['', Validators.required ],
    lastname: ['', Validators.required ],
    telnum: ['', Validators.required ],
    email: ['', Validators.required ],
    agree: [false, Validators.required ],
    contacttype: ['None', Validators.required ],
    message: ['', Validators.required ]
});
```

Inspecting Form Control Properties

- You can inspect any value within a form control and its property as follows:
  - e.g., feedbackForm.get('firstname').status, feedbackForm.get('telnum').hasError('required') etc.

Property	Description
.value	value of the form control
.status	validity: VALID, INVALID, PENDING, DISABLED
.pristine/.dirty	true if user has not changed/changed value in UI
.untouched/ .touched	true if the user has not yet entered the HTML control and triggered its blur event
